Portrait Light Evaluation Tool Instructions**

1. Fold at 90° angle. Hold card vertically, near your subject's face, with the darker side toward the light source.
2. Change your orientation (or your light, if you have control) so that the two halves appear to be the same shade of grey.
3. When the two halves look the same, you have achieved a good 2:1 lighting ratio. Shoot away!

Printing instructions:

This Portrait Light Evaluation Tool works best when printed on non-glossy paper, preferably on a thicker card stock.

It is configured to print on 2-sided printers (US Letter).

If you don't have a 2-sided printer, then print just this side and fold along the dotted line so there are 2 grey squares on one side and instructions on the other.

Use as demonstrated in the video.
